

Stop it Before it Spreads

- Everybody talks about computer viruses, but how much do you really know about them? A virus is a program designed to damage or alter data files. It can:
 - Replicate itself and make changes.
 - Attach to emails and spread from computer to computer.
 - Infect boot sectors on hard drives.
 - Be transferred onto a thumb drive.

Learning more about computer viruses can help protect postal information resources.

And that's smart business.
